

This is how the official Google Cardboard looks like when unassembled. Your structure should look similar if not same.

doesn't cut it for you and you are looking for something more comfortable and custom made. Keep in mind, this will require more effort and skill, but will probably cost you the same. There are two main things you need to procure in this step:

- ◆ **Lenses:** Do not be lazy with this one. The more time you spend here, the better your VR experience will be. You could snag them out of your old binoculars or magnifying glasses, but better to go for 5x aspheric lenses which are good to go for 5" to 6" displays. Along with the lenses, you need to get a frame, maybe from old sunglasses or ski-goggles where you can fit them. If you have access to a 3D printer, you can download the spec sheets for Wearality Sky frame at <http://dgit.in/Wearality> (Wearality Sky is a VR lens with frames that comes with a smartphone holder)
- ◆ **Display:** Brand new displays do not come cheap. On the other hand, using a smartphone or a tablet as a display might add weight to your device which you do not want. You can either go for one online after verifying the seller, or you could snag one off an old tablet or a netbook.

Note: If you are using your own display, which this tutorial is going to be based on, then you need to have a microcontroller board which is generating
