

the entire VR experience for the display or connectivity of the display with a PC. You can find a number of online resources to achieve that.

Step 2: The Main Case

Cardboard isn't the only choice for building the main body of your headset. That was essentially Google trying to convey how easy it is to experience VR. You can always go for a material that is both easier to handle and more comfortable, like foam board of dark colour. You can get it online or source it from your local hobbyist store.

The Oculus Rift faceplate for reference. Notice the significant grooves for the face and the nose, and the comfortable padding around all edges.

Before you begin, you need to find out the focal length of the lenses you are using and the width of the frame in which you will fit the lenses. Once you have that down, you need to cut two pieces of the foam board - the width of both will be the same as that of the lens frame, with the length of one being 1.5 times the focal length of the lens, and that of the other being 1cm more. These are your top and bottom pieces respectively.

Similarly, the length of the side pieces needs to be the same as that of the top piece and the width needs to be as long as the short side of the
