

screen that is being used. As for the faceplate, once again the width needs to match the width of the frame and the length needs to match the short side of the screen. You will need two of the faceplates between which you will house the frame.

Cut out adequate arcs in the side pieces as well as the bottom piece to accommodate your face and nose.

Step 3: Assembly

A very helpful tool here would be a glue gun.

- ◆ Start with the back panel by hot gluing the top and side panels to it.
- ◆ Check if the eye panel (the faceplates) fits inside it, then remove that and place the LCD face up into the case.
- ◆ Place the controller board at the back and position the wires accordingly, then hot glue it too
- ◆ Glue the controllers switch to the side of your choice.
- ◆ Place the lenses inside the box and adjust it until the display is in focus (you can load up a static screenshot to check the same).
- ◆ You're all set!

Step 4: PC Connectivity and Head Tracking

You can put to use several SDK's available from a number of headset manufacturers. Your best bet is Oculus due to the rich developer ecosystem already out there. If PC connectivity is achieved, a large number of possibilities are unlocked.

Head tracking from ground up is an extensive topic and will require its own chapter, or perhaps subject. Your best bet here is to go for Oculus' head tracking system available online, or evaluate your alternatives between a 3DOF sensor, an arduino sensor, an air mouse or an infrared tracker before you check out the implementation in this instructable here : <http://dgit.in/NovaDIY> (Caution: The instructable tutorial is for DIY Nova VR headset, and it might make you change your approach midway. Better to start over anew if you want a more detailed approach)

Step 5: Relax

Now that you have your VR headset ready and can't wait to use it, fire it up and let us know your experience! If you are interested in the software side of VR development, or simply want to know what actually makes up the next big interactive experience, we are covering that in a later chapter.
