

AR Vs. VR?

The two technologies aren't identical for sure but are they at war with each other? Let's find out.

Augmented Reality and Virtual Reality are two of the most confusing terms in the modern day technological playground. Though they sound similar and may seem somewhat identical to a lay person, they differ by leaps and bounds just because of the core nature of their interaction and operation.

Imagine you are sitting in a restaurant and in your thoughts your city is being attacked by aliens and you plan to fend them off using your own lightsaber. How cool would that be? If so, Augmented reality could be your way out. One thing that should be noticed here is that your surrounding is filled with aliens, but you are still at the restaurant. So, Augmented Reality is the a subset of mediated reality, where a computer alters or modifies the real world to bring out a digital experience eliminating the need to build the entire basic underlying structure, virtually. Simply, AR is built on top of the real world to give an ameliorated view of the real world using digital components. Some of the most famous Augmented Reality devices include Google Glass and Microsoft HoloLens.

Imagine the aforementioned scenario again, but this time, you are transported to an outside world such that the entire surrounding around you resembles an alien planet. Nothing around you resembles the restaurant or your previously existing surrounding. This phenomenon could be attrib-
