

A typical VR headset

for visualization and training, it has now gained traction in the fields of assistance, entertainment, gaming, etc.

Since both the technologies have eventually evolved from a common past, it is natural that they share certain traits, that are identical. For starters, both the technologies need a virtual simulation of the real world partially or completely. On close scrutiny of both the technologies, it is evident that the central idea of both AR and VR revolves around projections that might be in multiple dimensions. These dimensions may sometimes include touch, smell, and other human senses. Attributing to this fact, AR and VR inherently leverage on the same sort of technology to engage its user with an enriched and enhanced experience through the application of the technology, though this application might not be identical. But even if the underlying technology remains same, the application and implementation of this technology may differ significantly.

If we dig into the commercial aspect, both the technologies focus onto the same target audience and operate in similar business domain. The primary target being the entertainment industry often focused on gaming with an emphasis on better and immersive experience for a tech savvy user. In
