

The Explorer version of Google Glass

concerns, performance problems, and negative publicity. But Google plans to release a revamped version of Glass sometime in future, with refreshed OS and modified hardware.

On the other side of the spectrum, we have OculusVR, a Virtual Reality company that had garnered the attention of public when it was acquired by Facebook for \$2 billion. Its flagship product is Oculus Rift, which is a head-mounted VR display with the primary focus towards gaming. It provides 3D surround sound using integrated speakers along with positional tracking using the IR sensors.

Magic Leap is another budding device which brings up the concept of “mixed reality”. Essentially it takes up components from both AR and VR and simulates a virtual world according to the surrounding only to the end user. Unlike AR, it does not project 3D holograms rather only augmenting the real and the virtual world. Magic Leap is a Florida-based startup which has received funding from Google, Qualcomm and Alibaba. On similar lines, Microsoft developed HoloLens which are a pair of smart-glasses that come with an inbuilt Windows 10 computer and advanced sensors with a natural user interface.

While these are not the only VR and AR devices available on the shelves, numerous other companies have launched their version of such devices which include (but are not only limited to) PlayStation VR, HTC Vive and Samsung Gear VR.

In addition to the products that are being built by tech-giants, Sixth Sense is a research technology that uses gesture recognition for motion detection
