

◆ Click @360 degrees

Modern day entertainment is woven around the very concept of good photography and videography – case in point: Youtube. While cinematographic cameras have always developed content for us, 360 degree cameras have recently started coming into the picture. One fine example is the Nokia Ozo used to record VR-compatible content.

Nokia OZO the new 360 degree camera.

◆ VR development

While every other company is trying to come up with new ways to target the consumer, there is one which is sneakily but smartly focusing on the developer community. Envelop VR has created a whole suite of VR software including VR inside VR development suite, 3D projects and data visualization suite among others. Perhaps they realized: ‘if everything is for the consumers, who is going to develop relevant content?’ and decided to do something about it!

Medical Industry

Medical sciences have always been on the lookout for new avenues to increase patient support and improve healthcare. The usage of robotics for modern day surgeries, for instance, was a great move. The community had this brainchild even as the world was contemplating how to make our day-to-day lives lazier using robotics, and history repeats with VR:

◆ Let experience this surgery

Medical Sciences display immense potential for migration to VR simulation, and they’re getting onto the bandwagon faster than any other industry – a statement supported by the fact that just some days ago, Dr Redmond Burke of Nicklaus Children’s Hospital in Miami successfully operated an infant with only one lung and half a heart, a condition which most doctors had rendered lethal and inoperable. In order for the infant to survive he had to connect her aorta with her pulmonary artery and place
