

bundled with VR headset and sensors. It is literally infinite, owing to its omnidirectional movement capability and a harness which stops you from running off of the device.

Education Industry

Education is the one sector which has managed to remain unaffected by the magic of VR despite all the technological development surrounding it. We owe this to a very simple fact – the sheer lack of alternatives to the standard learning process – thanks to which our education system still thrives on texts. But all that can change with the introduction of VR. Visualizing what we learn about is as important as learning itself; it enables us to understand facts better. Therefore, we can control content and its mediation. For example, you are studying a chapter on the Battle of Waterloo, wouldn't it be brilliant to be able to simply walk into the battlefield and find out for yourself why Napoleon was defeated? Doesn't it sound like a much more fun of studying history than listening to a teacher yammer on about it? Not just that, you could probably even simulate how an induction motor works.

♦ Field Trip from classrooms

Field trips needn't be on the field anymore. Google Expeditions enables students to visit all the popular landmarks where schools generally take
