

♦ **Sergeant get these ladies up and ready for training**

The US army has been using simulation training for decades now and are the earliest adopter of VR – even before gaming conglomerates swooped down on the concept. The army has taken this platform to the next level with their usage of haptic feedback systems for providing the soldiers with real world senses – a system which supports VR and in turn provides the user with a precious, immersive experience. So, to sum it up, using simple VR + haptic feedback, a soldier can learn the tricks of warfare without having to go to a war.

♦ **Walk on space from earth**

Astronauts have to train in hundreds of simulated environments to get a sense of how it feels to be in space. But that too, does not provide the real experience. NASA, however, in collaboration with the US army, introduced the same haptic feedback system and VR module to present to scientists with the same space training. And the results were better than when they used other head mounted display (HMD) simulations.

♦ **Better be safe than sorry**

Industrial training and safety are a niche area that is yet to evolve. But what if they adopted VR? It would lead to an explosive growth in the industry as real world experience beats textual knowledge, any day. Manufacturing companies should look into integrating VR for simulating various hazardous situations while training new workforce.

Marketing Industry

Everything gets commercialized at one point or another – it's just a matter of time. But what about industries that are already based on this economic model? As content is becoming VR-compatible, products also need to be VR-ready. Imagine how cool it would be to try a shirt and see the VR shop assistant suggesting your exact size, and getting it delivered to you the next day. It's like the garment's designed for you alone.

♦ **Try it before you buy it**

What if you could try out an article you're buying before you spend money on it? Following this example, Boursin Sensorium tried to sell soft cheese via a new VR commercial. As immersion takes off, we could have a whole lot of products customized only for us.
