

Who's going to win this race?

At the moment, it's a strictly grey zone. But when we look at each industry part by part, we may have a better understanding. Let's look at the data and analyse:

1. The entertainment industry will easily win customers over because they are not charitable enough to hand over content for free and we are not obstinate enough to dismiss watching TV or videos ever.
2. Content Creation and development will be the ultimate winner of this race because...let's face it, no industry can survive without content or evolve without developers onboard.
3. The stagnant industries are education, training and simulation as they are never meant for gaining profits, although people will pay money to buy their stuff nonetheless. But this fund will be directed towards improving the ecosystem.
4. Medical science is a field which can show both positive and negative outputs based on the way people perceive it.
5. Marketing industry will get a kick out of this whole ecosystem, as they can convey their products to a more specific customer set which is really invested in buying it.

Wrapping up

The aforementioned is just the beginning of the virtual reality revolution. Although these industries have been on the forefront of this race, they haven't been able to bring out the total potential of this platform. The day, however, is not far ahead when, if you want to learn a cuisine, you could just work beside world class chefs. What would be really interesting though is the rise of mixed reality, which will enable us to walk between AR and VR without toggling between HMDs.
