

THE CONTENT SIDE OF VR

With the VR craze growing steadily every day, becoming a VR content creator is the need of the hour

Experiencing VR in everyday life is possible now. As we saw in the last chapter, VR could be a lot more than just a new way to play games. In fact, it has the potential to surpass the current modes of communication and provide never seen before clarity in information transmission, where the receiver sees the information as it is, or rather we can say that he or she experiences it. To achieve this level of learning through any other method it would cost significantly more.

We do agree that most high grade VR headsets are not coming cheap. But that price is just a one time investment that, if put to use well, can pay off exponentially. And that would only be possible for anyone and everyone if there is a huge variety and amount of VR content available for everyone to harness. Who is going to make that content? Why, you ofcourse!

The weapons of choice

To begin with VR content creation, you have to first chose a medium. Currently, the options you have are somewhat limited. The first alternative available to you is VR video, or 360 video creation.
