

Video creation has two aspects – the visuals and the audio, both of which are being re-invented for Virtual Reality. On the visual side, what we require for full immersion is creation of 360 degree videos. It is quite obvious that no single lens can have a 360 degree field of view. For an image to be formed, light has to pass through the lens and fall on a sensor, and on a hypothetical 360 degree lens, there would be no place for that sensor. So we make do with the next best thing, that is multiple lenses on one camera.

As with other VR products, there are multiple VR cameras in the market right now and some of them are really good.

Of all the cameras out there in the 360 video competition, Ricoh Theta is perhaps the most popular and the longest used one out there. The way this camera approaches the increased field of view is similar to a fish's ability to see almost 360 degrees. The camera has two lenses - one in the front and one in the back which combine to give full 360 degree motion and video capture capabilities. Moreover, the device supports a framerate of 30fps for the video and can store upto 25mins of it. You can also use your smartphone as a life viewfinder using the dedicated smartphone app and once you are ready, you can even live-stream a 360 video, directly from the device. There are two models - the full fledged Ricoh Theta S and the much toned down Ricoh Theta m15.

If your intentions are more professional than the average creator and the pricing isn't a concern, then Nokia OZO is the correct device for you. At first

As shown in the picture, the Ricoh Theta works well with mounts too.
