

with new chip models that will enable a product to function in such a way that light fields can be projected directly into the wearer's eyes. Companies like Oculus, on the other hand aim to capitalize on the already existing smartphones and PCs to bring out an affordable product.

2. WakingApp

The Israel based WakingApp is an augmented and virtual reality content developer. But those words don't convey the excitement which their latest project has created in the geek circle. For the company intends to create a cloud based platform, having the savvy name of ENTiTi Creator. With its aid, users can create their own AR/VR content, and here's the key thing-you don't have to have any programming experience WHATSOEVER to do that! That's like saying you can cook a gourmet meal with a push of a button, without knowing how to cook.

The tools from WakingApp already cater such things as games, live data feeds, 3D imaging and even 3D animation. The solution they provide gels well with many of the leading AR/VR platforms including Samsung Gear Vr, Vuzix and Epson Movario. According to the company's CEO, Udi Shani, smart glasses will be a growing trend in 2016 but the products lack the feasibility to exist long-term unless there's good content for them. This is apparently where WakingApp comes in.

3. Matterport

The name may conjure up the word 'teleport' in your mind. While the business of Matterport isn't quite that, it's not completely disconnected from the idea either.

The company's main product, in fact is a camera. The fact that it costs \$4,500 must be enough of a hint to know that it's not a regular point and shoot we are talking about here. Along with softwares across VR
