

Briana Lempesis at the Palo Alto Apple Store via the Beam Telepresence robot.

These two technologies are not from the future. They are here right now and are being used. Robots with increased abilities to navigate all terrains are being developed and perfected all around the world. Humanoid robots have been demonstrated last year at multiple technology meets around the world, robots capable of replicating facial expressions using actuators under the skin. “Yangyang”, unveiled at Beijing’s Global Mobile Internet Conference last April, can frown, smile, and have a number of expressions based on what it perceives on the user’s face.

Most of us remember ‘Second Life’, a virtual experience that was developed to mimic real life in terms of the social interaction. The experience made you create an avatar for yourself and that avatar could fly from one location on the map to another, and in one particular location it could interact with other avatars, buy property, own vehicles, attend parties, conferences, events, school and anything that could possibly be imagined. In spite of the fact
