

theatre and merge it with the potato chip fuelled lethargy of their couch. The television industry single-handedly revolutionised display technology. Imagine, if you can, the first generation of TV viewers guffawing to Charlie Chaplin falling down an assembly line in *Modern Times*, all from a magical box in their living rooms.

The people couldn't get enough of it! At around the same time, the world of CRT's was continuing to evolve. Growing in complexity, engineers were experimenting with the possibility of incorporating colour into their screens, which eventually resulted in the first colour CRT displays in the 1950s which used differing shades of red, green and blue light to produce coloured images.

Personal televisions of the 30's and 40's

Replacing the CRT

The 1960s witnessed a slew of new display technologies arriving onto the scene, many of which are still in use today. The first Light Emitting Diodes(LED's) were developed at Texas Instruments at around the same time that Liquid Crystal Displays(LCD's) and Plasma Displays were being developed which used the light modulating properties of liquid crystals and ionised gases respectively. The first LCD displays were used in simple
