

series of iPhone and iPod devices, and other companies were now forced to offer Ultra HD touch integrated displays as part of all their devices. These screens have gotten progressively better with each generation of smartphone and TV and is sure to continue to do so.

The future: Now in ultra-realistic immersive HD!

That's where we stand, at the pinnacle of visual display technology, but this is not the end of the story by any stretch of the imagination. Flat screen TV's are now passé, curves are in. Offering a better viewing experience, these next generation curved displays are also adopting the technology offered by the new wave of 4k technology: the magic of displays which offer four times the pixel density of a normal 1080p HD device. These curved

The magic of 4k displays

televisions are also likely to have 3D as a standard part of their working technology very soon, offering a more immersive experience for the viewer.

The most exciting development in the past couple of years that is set to revolutionise display technologies, is the idea of Virtual Reality(VR). Ever since Facebook bought the company Oculus VR for \$2 billion in 2014, the Oculus Rift has become the most anticipated product in the world of technology. Slated for release in March of this year, this device has captured the
