

**DO I NEED A 4K TV?**

Short answer is that you don't. The human eye has a finite resolution and it's impossible to tell the benefit of a 4K (Ultra HD) resolution from the ideal viewing distance. Unless, of course, you're using a projector on a 11 ft screen. Ultra HD in 40-inch and 50-inch screens makes no sense unless the viewer is sitting a foot or two away from the screen. Furthermore, the lack of 4K content means that your existing Blu-rays and Full HD will end up looking awful because digital flat panel displays only look good in the native resolution. Don't fall for this gimmick until you have enough 4K content to justify the purchase.

fascination of people around the world, with its promises of a completely immersive world that the user can pop onto their heads. Since the idea of VR exploded onto the scene, many other companies have started-up, including many from India such as Absentia VR. These companies offer HD displays, 3D audio tech, rotational and positional tracking with their devices, which will make entertainment such as movies and games a novel experience by completely transporting the viewer to a different world altogether.

With a lot of exciting innovation happening at this very
