

Especially, S-PVA and cPVA panels have improved response times and contrast ratios. These typically offer 8 ms G2G response times but like MVA, overdrive helps bring this down to a much lower value. We've seen VA panels with under 5 ms G2G response times. If you do ever come across Ultra-wide VA panels, then they'll typically sport a PVA panel and the same can be said for curved displays as well.

Panel derivatives

MVA

Advanced-MVA

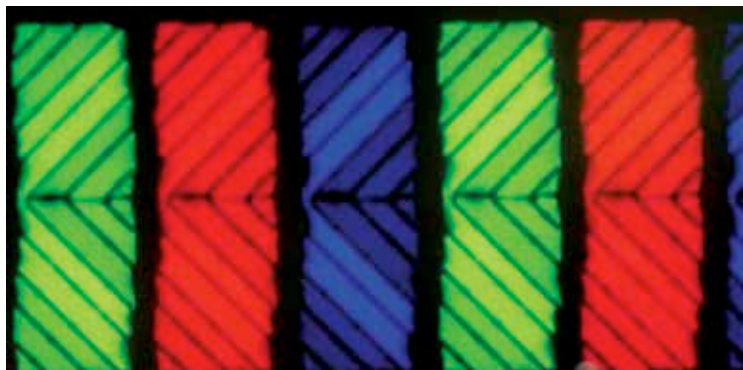

AU Optronics came out with A-MVA in 2005. It was designed to reduced colour washout that was prominent in early VA panels. This was primarily accomplished by creating more domains than before and by reducing the variation in oblique angles. They provide extra-high contrast ratios compared to TN and IPS panels.

Advanced-MVA

Sharp's MVA

Though not a large manufacturer as the others, Sharp's variant of MVA was the first to hit 120 Hz refresh rate making it a lot more appealing to gamers.
