

like the ones produced by Sharp appeal to gamers thanks to the really high refresh rates.

- ◆ Even the panels produced by AU Optronics are capable of low response times thanks to overdrive.
- ◆ Current MVA panels offer 8-bit colour depth

Cons

- ◆ Response time is comparatively lower than TN and IPS panels.
- ◆ Even current generation of MVA panels suffer from off-centre contrast shift or black crush which makes it not so great for design and photography work
- ◆ Viewing angles have improved a lot but IPS is still better.
- ◆ There aren't any panels with 10-bit colour depth

Pros and Cons PVA

Pros

- ◆ PVA panels have pretty decent contrast ratios but not as great as MVA panels. A contrast ratio of 1200:1 is commonplace with some panels going all the way up to 3000:1.
- ◆ Response times are still lower than TN panels but overdrive is more than sufficient for the average user.

Cons

- ◆ There aren't any panels with native support for 120 Hz refresh rates
- ◆ Off-centre contrast shift is still present in all PVA panels.
- ◆ Viewing angles are still not as good as IPS panels.
- ◆ There aren't any panels with 10-bit colour depth
