

IN-DEPTH: IPS DISPLAYS

Having an IPS panel may not make you a world class twitch streamer or an FPS pro-gamer but it surely will make you appreciate rich colours than ever before.

During the late '90s, the terms TFT, Active Matrix and TFT LCDs were becoming major marketing buzzwords among computer display manufacturers as the new panels were slowly gaining market share. Around the same time, Hitachi filed its patent for a new display panel technology called super TFT, which was later coined as In-Plane Switching liquid crystal displays (IPS LCD). It was simply a different technology variant of thin film transistor liquid crystal displays (TFT LCD) but with much better colour reproduction as you'll come to know soon.

They were all the buzz when first released because they boasted great colour and contrast in comparison to the then available Twisted Nematic and Vertical Alignment panels. But what they lacked was impressive pixel response times compared to TN panels. But that didn't stop people from getting giddy about this new piece of technology. But what they failed to understand was, it simply was another variant of an LCD display and currently every
