

- ◆ **Advanced Hyper-Viewing Angle (AHVA)**- Made by AU Optronics, it's the first one to boast of a 144 Hz refresh rate which is a huge leap as there are not many manufacturers who can manufacture premium quality display which are light on your wallet.

Did you know?

What is FRC?

Frame Rate-Conversion or FRC is the method to double the frame rate output of a monitor by calculating and inserting

new frames in the stream. It is widely implemented in the movie industry when during post production, it allows for the application of different effects. Also, it's quite helpful for stitching frames from different sources. IPS displays pre-2010 required FRC to compensate for low refresh rate and post-2010 for increasing frame output to compete with TN and VA panels. 

WHAT DOES THE CONTRAST SETTING DO?

It's the ratio of the darkest and the brightest picture that the TV can render. A TV with a high contrast ratio will be able to show deeper blacks and brighter whites. It is arguably one of the most important and the easily palpable picture quality parameters. Even more so than parameters such as colour and resolution, because contrast ratio categorically decides whether the picture will appear vibrant or washed out.
