

- ♦ **Mobius:** E-Ink's flexible display that allowed the development of rugged lightweight devices that were suitable for much larger e-Ink displays. This put to use flexible TFT technology, and consists of a plastic TFT laminated to an E-Ink front plane laminate. Although they can sustain some flexing and hits, A4 size Mobius displays are the most expensive of E-Ink devices, as seen in the Sony Digital Paper DPT-S1.

- ♦ **Triton:** In November 2010, E Ink announced the third generation of E Ink displays. The Triton is a colour display that is easy to read in the light. It has the ability to display 16 levels of grey as well as 4096 colours. This

piece of technology from E-Ink further has further closed the divide between conventional and electronic paper. It was used in the Hanvon colour e-reader as well as the PocketBook Colour Lux.

- ♦ **Segmented Solutions:** These displays are ultra-low power (0.5 micro amps per cm^2 to switch the display and zero power for a static image), thin (380-560 microns), rugged (non-glass and shatterproof) and sun-light readable with a 180 degree viewing angle, allowing them to be used in devices where a display would have otherwise not been possible to include due to size, power or environmental constraints.

WHAT ARE JANUS PARTICLES?

Janus particles are a particular type of nanoparticles in which the surface can have two or more distinct set of physical properties in different areas. This allows two different chemistries to occur on the same particle. This is usually achieved by dividing the nanoparticle into two different parts made of two different materials, for example one half can have a hydrophilic material whereas another can have a hydrophobic material. This technology was used in the first ever E-paper display, the Gyricon, where one half of the particle was positively charged whereas the other half was negatively charged and the two halves were colored black and white respectively.

Pros of an E-paper display

- ♦ Lower power consumption on these displays allows a battery life of days on some devices which use them.
- ♦ Due to the paper-like appearance, the strain on your eyes is almost negligible.
