

The Pebble watch that uses E-Ink technology, there is no apparent glare in daylight

- ◆ Due to the reflective nature of the device, no glare is experienced under bright lights or direct sunlight.
- ◆ Even if the device is powered down, the display can retain the last image on it, making it very useful for displaying maps and important information.
- ◆ The advantage of experiencing paper without the environmental collateral as well as the lack of authenticity in the experience.

Cons of an E-paper Display

- ◆ Most E-Ink displays cannot render full colour publications due to the limited or no range of colours available apart from black and white.
- ◆ Even until very recently, there was no support for hyperlinks and other features that you can expect from a multimedia device.
- ◆ Compared to other display technologies, e-Paper suffers from a very low refresh rate that makes it unsuitable to be used with sophisticated interactive applications like fast moving menus and mouse pointers. Applications like zooming are affected with blurring or slow speed.
- ◆ Shadowing or Ghosting might affect the viewing experience. Some pixels might partially retain their previous state due to the magnetic nature of the technology, although this can be solved by multiple alternate refreshes between black and white states. This is done in many devices when loading a completely new image.
- ◆ Colour e-Paper displays cost a lot more than their black and white counterparts.
