

colour reproduction, especially the black levels. Viewing angles, colour saturation and contrast levels aren't very high either, but LCD still managed to rule the market, owing to its easy availability and low cost. In 2013, just when LCD was at its peak, OLED displays started gaining popularity. Invented in the 1970s, OLED was difficult to manufacture for large panels. Well, not anymore. Claiming to bring about a revolutionary change in the picture quality along with slimmer panels made sure that OLED had the attention of tech enthusiasts and manufacturers, alike. Organic Light Emitting Diode, commonly known as OLED had slowly started gaining attention in everyone's eyes, owing to its capability to provide very high picture quality and excellent colour battery consumption.

Major players like Sony, Samsung, Panasonic, LG, etc. were investing all the resources they could towards OLED R&D. Sony partnered with Panasonic in mid-2012 for mass production of OLED panels. LG and Samsung were not far behind either. In 2013, analysts predicted the OLED television market to jump to 16 percent of the overall market — up by 4 percent in 2012 — and to \$20 billion by 2018. CES 2013 saw a host of 4K curved TVs by all major TV manufacturers along with few concepts of potentially flexible display panels. By 2014, Panasonic and Sony decided to end their partnership and Samsung was seen to cut down drastically on the investments to develop this technology. On the other hand, LG unveiled the LG G Flex, a smartphone with flexible display and seemed keen on OLEDs.

By 2015, Sony was still “looking” into the technology and Samsung seemed more focused on developing its SUHD panels. LG took the lead

WHEN WAS OLED FIRST INVENTED?

The world's first viable OLED material was invented by researchers in late 1970's. Kodak was the first company to have an commercialised AMOLED products and has over 1900 patents and 15 licences related to OLED. Kodak, was the first one to make the WRGB AMOLED architecture using white light emitting OLED. It then collaborated with Samsung for further development of OLED display panels. Their complete absence of in the display monitor industry made them sell the entire business to LG in 2009 for \$100 million which made them the owner of White-OLED with colour filters, OLED lighting and the OLED manufacturing method.
