

to explore more opportunities here, along with improving the efficiency of producing OLED panels going from 10% efficiency rate to 80% efficiency rate in producing OLED HD panels and 65% in OLED UHD panels. (<http://dgit.in/LGOLEDyeild>) LG rolled out some of the most interesting television display panels including its Floating Air Slim designs, that made LG the OLED market leader it is today. LG has continued to impress even in 2016 by showing off its 18-inch fully rollable display which it claims could go up to 55-inch. We also

First OLED panel on display by Kodak

saw leading laptop manufacturers like HP and Lenovo welcoming OLED display panels along with other manufacturers who joined in, just to not lose out on jumping onto the bandwagon.

Working of OLEDs

A simple OLED panel is made up of six layers. OLED display panels use organic carbon based films that are combined together between a pair of charged electrodes, a metallic cathode and a transparent anode. The transparent material (anode) used usually is either glass or plastic, which is an organic compound and thus the name, Organic Light-Emitting Diode. These organic materials usually contain carbon at a molecular level. The basic compound of an OLED are the seal, the substrate, the anode, the organic conducting and an emissive layer and lastly a cathode. The
