

stacked on top of one another to squeeze in more pixels packed into each inch of the display to attain higher resolution.

Future of OLED

Where all the electronics are getting smaller day by day, displays are one thing that we don't want to compromise on but do not want to carry along the bulk of it. Imagine a device that of the size of a pen, can be rolled and kept in your pocket conveniently, is actually a smartphone flaunting a large high definition screen. Any gadget that you would be buying soon, be it a flagship or a high-end router (considering that routers these days come with a screen on top), have the potential to have an OLED display staring at you. OLED display panels currently are the best bet for your money if you want the best output. They're expensive, no doubt; but never fail to deliver a mesmerising, ultra-vivid output.

The ability to be flattened and rolled is something which others panels cannot offer, at least till now. LG has always been at the forefront of developing OLED technology and in the Q1 2016, LG displays have invested a whopping \$380 million in a production facility for OLED panels after selling 400,000 in 2015, out of which half of that came in Q4 of 2015. This investment is to address the "growing market demand," says LG.

Another much-appreciated product by LG is its OLED rollable display it had on display at CES 2016. OLED display panels have opened up an entirely new sector of displays i.e. flexible and rollable displays. Reports suggest that Samsung has also got onto the bandwagon and has started

OLED Display Shipments and Growth by Application
