

mean that it's going to be your artificial friend for ever and ever more. For there inevitably comes a time when something better overpowers the tech currently in vogue, or is made obsolete by the unforeseen yet remarkable effects of misjudged financial decisions.

Ever since television became THE thing around which families gather in their living rooms, display technology has been subject to massive improvements. And once smartphones and tablets took off for good, the quality of such technology has been the single-most important factor in determining the success of many a product. The tidal wave of innovations in the category has caused the demise of many a piece of technology as well. Here are some of the ones that are in the last leg of their run, along with the reasons why they won't be around for long to delight you.

Plasma

As far as longevity of technology goes, over a decade is a reasonable span of time-especially in the modern era when things come to life and die like the flicker of a lamp. Plasma TVs have enjoyed a strong reputation as the hottest thing in image projection for more than a decade. Aside from the fact that OLED TVs, during this same period kept bridging the divide in terms of picture quality there are a few other reasons why we view the fade out of the Plasma technology as an inevitability in the near future.

Reason(s) why it's on the way out:

Cost: One major reason why Plasma is not gonna be around for long is the dip in the production cost of LCD panels, owing largely to the facet of mass production. The cost has come down enough to make it competitive with that of Plasma and entrepreneurs being what they are, assess they can make more money by sticking to LCD. Exit Plasma.

Marketing: Panasonic was one of the pioneers in Plasma category whose products were so superior to their competitors' that they could produce a whole other concept of the technology in the consumer's mind. Unfortunately though, even with the superior products, Panasonic failed to outsell their rivals because of their shoddy marketing. This resulted in an odd scenario in which only those whose job is inextricably linked to such technologies-like reviewers and sellers knew about the technology's true potential. This made it hard for Plasma as a technology to take the fancy of the audience as much as it should have. If the contrary were the case, the technology could probably have remained alive for a long while
