

Eidophor – too big for its own good

Reason(s) why it's on the way out:

Adoption of the technology remained rare even during its early years because of the fact that the Eidophor was a huge device affording minimal ease of portability. In fact, the technology found its early user in NASA when a space program required such a technology-not exactly an everyday happening.

But Eidophor did find its use in the entertainment sector, particularly when the device was used extensively for visual amplification in live music shows performed in large arenas such as stadiums. But the fact remained that Eidophor was still a huge device (and the passage of time didn't make it all that smaller either). This spelled doom for Eidophor when in came the 1990s for that was the decade which saw huge advances in the projection television technology. The technologies that proclaimed the birth of a new era in visual technology -like Liquid Crystal Display(LCD) and Digital
