

Reason(s) why it's on the way out:

But having its origin in such an esteemed establishment hasn't ensured longevity for the technology, or so it seems. But the fallout that Gyricon experiences doesn't come from quality issues but from the lackadaisical responses that e-papers in general are receiving from the market. To put the same in a single word: tablets.

There doesn't seem to be any slowdown as far as people buying new tablets and smartphones goes. And e-readers, though they have been around

Gyricon

for a while hasn't yet received the acceptance that was hoped for. The e-paper companies were hoping to ride the wave of e-readers, a wave that never truly surged. Incidentally, both Gyricon and E-ink use microscopical balls for their functioning though of different kinds. Unfortunately, both the technologies seem to be facing the same grim future.

Being a predominantly visual oriented animal, human beings derive most of the information from their surroundings through their eyes. Given this fact, it's not surprising that brands would always try to up their ante on the quality of displays that they bring to the picture-no pun intended. And that being so, innovations in display technology can easily be expected to persist and it's the survival of the beautiful and the relevant that we are looking at in this segment.
