

A MOUNT FOR THE HEAD

Head-mounted displays have finally arrived full-scale. How do they fare in the already massive and diverse Display market?

It seems that even until very recently, whenever we think of virtual reality, the only idea that we had to go on was of a person wearing something on their head - a pair of darkened goggles, a headset, a helmet or something similar and experiencing a world not so different from the ones shown in popular movies like The Matrix. Come 2016, full-scale virtual reality headsets are all but flooding the market. From Facebook's acquisition of Oculus Rift to Google's Cardboard initiative, head mounted displays are planting their feet deeper into the ground and are planning to stay. Let us have a look at how things got this way by tracing the journey of VR

- ◆ 1957 : Morton Heilig's Sensorama - a device that used sight, smell, sound and wind to simulate reality
- ◆ 1961 : Headsight developed by Philco Corp, an HMD with head tracking to train the military.
