

CALIBRATION AND A POST PURCHASE CHECKLIST

A few things you should look at after
having purchased your new display

Your labour of love is now complete. All the days of restlessly trawling e-commerce websites, price comparison engines, and haggling with dealers in hardware shops have finally come to fruition. Be it an OLED TV, 144 Hz gaming monitor with all sorts of bells and whistles, or curved LED-backlit LCD abomination – the most important step involves making sure the darn thing works. While this may seem trivial and stating the obvious, that only applies when you have display that comes dead out of the box. However, real life isn't all black and white, you come across shades of grey. By that, I mean displays that seem to work fine out of the box, but have damning issues or even niggles that range from mere annoyances to rendering them practically unusable.

Seek Replacement Within a Week

Whether or not the manufacturer has done its quality assurance, it's your job as a power user to detect any latent or dormant flaws and claim the initial no-questions-asked returns policy. The very first step therefore involves
