

The social media platforms

A social media platform is a tool that allows users to build and promote community engagement, conversation and share user generated material. Each platform was build to serve a unique purpose. Some platforms are used for professional networking e.g. LinkedIn, some are used for friendly interaction e.g. Facebook and some are used to help users voice their opinion e.g. Twitter.

Currently the top social media platforms are Facebook, Twitter, LinkedIn, Pinterest, Google Plus+, YouTube and Instagram. Every social media marketer vies to get the most number of followers for their clients on each of these platforms.

Marketers must understand the difference between followers and an audience. The Next Web reported that almost 138 million Facebook accounts are fake. Buying followers almost always guarantees buying fake accounts and this does not do much for the actual marketing campaign.

Choose a popular social media platform

Search engine optimization v/s Social marketing optimization

Search engine optimization is a set of tools and tactics to help improve a product's search engine rankings and bring people to the website. More importantly, to bring people to their website before they find a competitors website.

Social media optimization is SEO that has to do with all things social. This includes setting up profiles such that they become as visible as possible with interesting and shareable content. The term was coined by Rohit Bhargava on his marketing blog in 2006. He came up with a set of 5 rules with which anyone could influence levels of traffic and engagement on their website social media optimization is what proves to search engines that your content is valuable and of use to users. The more users share content or engage with a social profile the higher that social profile ranks on a search engine list.

SEO + SEM + SMO = High ROI

This simple equation sums up how marketers think these days.
