

Customize your message. Always.

ensure traffic to your website. Another way to increase site activity is to pick the right thumbnail for a link. You'd ideally like the thumbnail to be representative of the link, not a random image. If the link takes you to a product catalogue, say, you'd want the thumbnail to show a representation of the catalogue and not the logo of the company.

The timing and frequency of the posts is something that

has to be determined based on responses to posts but do avoid overcrowding of posts in a short span of time. While the consumer may view one or two posts from the same page on his/her timeline, any more is subconsciously classified as spam, in which case you lose the intent of the third post and subsequent posts and also end up diluting the value of your page in the minds of the consumer. Also make sure that you do post regularly, you want your page to be a constant presence on the timeline. Stay on the timeline, but don't encroach it.

Boosting and analysis of post performance

Your page has been set up and you've posted what you think are interesting and engaging posts. Now to the business end of things. You want as many people as possible to view and share these posts. There are many ways to do this, some that you can carry out by yourself and some that Facebook does for you.

We look at two ways to improve post performance: The boost option and an elementary analysis that Facebook will provide for you on your page.

Facebook gives you insights directly on your page. These insights provide an overview, a likes tab, a reach tab, a views tab and a tab that directly lists all actions performed on the page. The good thing about this data is that it can immediately be sorted based on age, gender, geographical location, time and other relevant categories. This provides a convenient way to quickly analyse and optimise your posts by customising it for maximum effectiveness. If you're a data nerd and want to get down any dirty with the
