

websites to become rich “graph” objects with the same functionality as other Facebook objects. Basically, Open Graph provides third party websites a degree of control over how information is supposed to travel from their website to Facebook when a page is shared or liked. The information is sent through Open Graph meta tags in the <head> part of the respective website’s code.

If you are using Wordpress as a CMS for your website, it would be very easy for you to set up Facebook’s Open Graph on your website using the following plugin –

♦ WP Facebook Open Graph protocol

It might also happen that you are using a custom made CMS for your website or might have a static website. In such a scenario, you will have to explicitly define Open Graph tags in your website’s <head> part. We will look into some of the widely used Open Graph tags below –

1. og:title

This tag defines your content’s title on Facebook. The title shown on a Facebook feed is in bold and eye-catching and therefore must be as compelling as a good post title. It serves the same purpose as the meta title tag in your code. Moreover, if Facebook is unable to find a og:title tag on your page, it uses the meta title instead. It is always advisable to limit the number of characters in the title to less than 90 characters.

Example:

```
<meta property="og:title" content="Your Open  
Graph Title Here" />
```

2. og:description

The Open Graph description tag is similar to the meta description tag in HTML. It is used to describe your content that shows below the link title on Facebook and has nothing to do with your SEO. The more compelling is the
