

title, the more number of clicks you can expect. It is highly recommended to keep the character count for the title to be less than 200.

Example:

```
• <meta property="og:description" content="Your Catchy Open Graph Title." />
```

3. og:image

A picture is the most essential thing that helps the content in standing out and thus is the most interesting Open Graph tag for many marketers. This Open Graph tag ensures that a thumbnail will be shown when the content is shared and hence may turn out to be very helpful for your conversion rates. It is highly recommended to set the og:image you choose, else Facebook will come up with something like an unwanted banner crawled from the page, or nothing at all.

If you are looking forward to a big thumbnail, which stands out from the crowd, as the one shown in the picture, then the recommended resolution for the OG image is 1200 pixels x 627 pixels (1.91/1 ratio). The images size shouldn't exceed the 5MB size limit. However, If you tend to use an image with resolution as small as 400 pixels x 209 pixels, it will render a much smaller thumbnail to the left of content on Facebook. Moreover, the image you use as an Open Graph image can be different from the featured image on the web page and just could be used as a leverage to stand out even more. One important thing to remember is that Facebook trims the sides of thumbnails, so it is recommended to lace your text, or the most significant part of the image in the middle.

Example:

```
• <meta property="og:image" content="http://www.yourdomain.com/og-image.jpg" />
```

4. og:url

This Open Graph tag defines the canonical URL for the page you tend to share. Now a days, it is very usual for the same content or page to be accessed through different URLs and through this Open Graph tag you can define one page that all your shares will go to. It is very much helpful if you have more than one URL for the same content (for example, using parameters). Moreover, the best part is that the URL provided is not shown on Facebook newsfeed and only the domain can be seen.
