```
<meta name="twitter:image" content="http://www.yourdomain.com /twitter-image.jpg" />
```

Schema.org and JSON-LD

Few months back, Google enhanced the abilities of its Knowledge Graph Box to support links from social networking sites. Google facilitated this enhancement by allowing the third party websites to add a structured data markup specifying the social profiles that are supposed to appear in search results. However, all the sites are supposed to go through a mandatory verification because Google will only show only those profiles which are verified.

Google recommends to use the Schema.org vocabulary and JSON-LD markup format to specify a markup. Schema.org is an open standard to incorporate structured data in webpages for Google to recognize the data as a social profile.

JSON-LD is a simple, fast and clean delivery vehicle for schema. Search engines can crawl this code with ease to understand the data more quickly. JSON-LD allows easy embedding of data in a script tag.

For most local businesses, some of the structured data that can be included are:

- ◆ Site Name
- ◆ Logo
- ◆ Business Name
- ◆ Business Description
- ◆ Address
- ◆ Geo-location Information (coordinates and map)
- ◆ Phone Number
- ◆ Email Address
- ◆ Social Profile Links via sameAs property.
