

To get an overview of all the packages, directories, and files in your project, we use the Project Tool window. It ease of use stems from the brevity of the view and the easy-to-understand tree structure in which it is represented. The window has three modes; Project, Packages, and Android. By default, Android Studio will set the mode to Android. Android and Project are the most useful modes, though the Android mode may hide certain directories from you.

Clicking on the 'Structure' tab present on the left of the Project Tool window switches the view to the Structure Tool window. This panel displays the hierarchy of elements in your file, where elements are fields, methods and inner classes. When the Editor is displaying a Java source file such as **MainActivity.java**, the Structure tool window displays a tree of elements such as fields, methods, and inner classes. This view
