

becomes increasingly useful when the complexity and length of code increases, since clicking on any of the methods scrolls the view and cursor to the corresponding element. Again, all views are represented in a nested tree structure.

Android Studio provides a way to quickly reference and open files that are frequently used. This makes streamlining the workflow easier when projects get larger and the number of documents become difficult to keep track of. The Favourites Tool window comes into play to help group related files that are useful. To add a file to the list of Favourites, you

have to right-click on the on the relevant tab and choose 'Add to Favourites', and then the name of the list to which you wish to add the document. You can also click on 'Add All to Favourites', and again the name of the favourites list.

Just as the Favourites window allows you to navigate immediately to any particular file or groups of files, bookmarks allow you to navigate immediately to any particular line in a file. Pressing F11 creates or removes
