

## Picasso

Picasso enables you to easily handle images in your Android application. The plugin automatically handles ImageView recycling, complex image transformations including memory and disk caching.

<http://dgit.in/picasso-lib>

If you think, Picasso lacks customisation possibilities, you can make use of Universal Image Loader (<http://dgit.in/univ-image-loader>).

## Sugar ORM

Sugar Object Relational Mapping (ORM) simplifies the process of establishing connectivity and management of SQLite database in Android. The plugin eliminates the need to write SQL queries and statements to work with SQLite database including management of object relationships. You can also consider using ActiveAndroid ([www.activeandroid.com](http://www.activeandroid.com)), which also does the same work as Sugar.

<http://dgit.in/sugarorm>

## JodaTime

JodaTime provides wide range of options to integrate date and time functionality into your Android app. You can build apps with date, without time and vice versa, full date and time with time zone and much more. In short, this library extends the default data class included with Java.

<http://dgit.in/jodatime>

## FreemiumLibrary

FreemiumLibrary helps you to build Android app by integrating premium features but your users will have to pay to use them via in-app billing v3 module from within the Google Play Store. The library also implements the AdMob library, which can be used to display ads to the user when they are using the app normally without payment.

<http://dgit.in/freemiumlib>

## Gson

Gson is a Java library, which is used to serialize and deserialize Java objects from and into JSON. You will have to make use of this library if you frequently communicate with APIs.
