

Saving Changes

Your repository is now ready to track files that you add, delete, and modify. To start with type the command **“git status”** that will give you the list of all the untracked files and folders in the directory. Type **“git add .”** which will track all the untracked files. This process is called staging. Once the files are staged the VCS tracks for the modifications. If you modify your Android code and type **“git status”** it will show you the name of the Java file that you modified. Once again you need stage the file. This time since it is a single file you can type **“git add <your filename with extension>”**. Every time you modify a file

being tracked, git status command will show the name of the file which is modified. You need to stage the file again.

Staging the changes doesn't save the state of your project, committing the changes does. Once you are done modifying the file and want to permanently save the changes with a note and a timestamp, you should use the **“git commit -m 'a personal note' ”** command. This command commits all the files that are in the

```

MHA2054@Studio Projects/androididm
C:\Users\MHA2054\AppData\Local\Android\Sdk\platform-tools
$ git status
On branch master
nothing added to commit but untracked files present (use "git add" to track)
Untracked files:
  (use "git add <files>..." to include in what will be committed)
        gitignore
        lib/
        build.gradle
        proguard.pro
        proguard.txt
        proguard.map
        settings.gradle

C:\Users\MHA2054\AppData\Local\Android\Sdk\platform-tools
$ git add settings.gradle
C:\Users\MHA2054\AppData\Local\Android\Sdk\platform-tools
$ git status
On branch master
Changes to be committed:
  (use "git rm --cached <files>..." to unstage)
        new file:   settings.gradle

Untracked files:
  (use "git add <files>..." to include in what will be committed)
        gitignore
        lib/
        build.gradle
        proguard.pro
        proguard.txt
        proguard.map
        settings.gradle

Status of your repository before and after staging.
Inspecting a repository

staging area with a personal note written in single quotes.

Git offers commands to inspect our repository. These include the one we have already used **“git status”**, and a new command **“git log”**. Since we have already used **“git status”** we know it is used to know the status of our files - whether they're committed or staged.

The **“git log”** command on the other hand is used to display the entire commit history. This shows all the commits that you made before in the repository along with the timestamp and the personal note. The log command makes it handy to get the previous versions of the code if you have messed up something.
