

Clicking the highlighted button will take you the App store page of Xcode

5. MultiBeast 4, which will help you get audio and other things working correctly after installation. You'll need to register for a free account over at Tonymacx86.com to download this. Make sure to download MultiBeast 4—it's labeled "Lion", but the Lion version runs better than the Mountain Lion version.

The set of instructions on how to complete the installation is available on Lifehacker. Google "lifehacker Run Mac OS X Windows VirtualBox", and follow the link to the latest post available in the long series Lifehacker regularly compiles on Apple VMs. But be prepared for errors and trouble-shooting that needs endless amounts of patience and googling.

The second workaround would be to create your own custom "Hackintosh", as it is. A hackintosh is simply any non-Apple hardware that has been made—or "hacked"—to run Mac OS X. This could apply to any hardware, whether it's a manufacturer-made or personally-built computer. Unfortunately, building your own Hackintosh is no simple task, and is best left to experienced programmers, who know their way around systems and hardware quirks. Aside from having to cherry pick a laptop with hardware specs close to a regular Mac, you'll often end up having to perform trouble-shooting for minute tasks such as the WiFi connection and audio issues.

If you've come this far, you're ready to start off with developing apps. If you're already done with developing an app you're probably considering releasing on the App Store, which is pretty commendable. However, it would
