

behoove you to make sure you've followed Apple's App Store guidelines. Seeing as how Apple is devoted to its mission "to provide a safe experience for users to get apps and a great opportunity for all developers to be successful", they go to extreme lengths to make sure it remains that way. Apple has strict App Store guidelines, and every title is tested by a human before being approved. In comparison, Google is happy to let most things fly — so long as it's not offensive or harmful — which gives us access to things like emulators and file downloaders that aren't available on other platforms. Apple's App Store review process is designed to keep the app ecosystem healthy and to protect users from low-quality or hostile apps. And the system mostly works.

The first thing to keep in mind is the complexity of the process behind publishing an app on the App Store. Apart from needing to create an Apple ID and a Distribution Provisioning Profile, you'll need a bunch of other certificates:

1. Mobile provisioning – this certificate is created in every instance where a new app is published in the App Store.
2. Push Notification certificate – this certificate allows developers to upload their app to AppBuilder.

The complete application will have to be made and submitted through iTunes Connect, a suite of tools for managing iOS applications. The application must have been configured or fine-tuned, especially in terms of the detailed information about the app you are aiming to publish, before submitting it to iTunes Connect.

In comparison, the Play Store process is laidback and stress-free. You only need a Google Play publisher account. Once you familiarize yourself with the publisher console and various tools provided, one needs to fill out the required information at the Google Play Developer Console, agree to the distribution terms, pay the corresponding registration fee (now at \$25) and wait for verification of payment and registration.

Apart from a slightly more comprehensive and lengthy publishing registration, the approval rates of the App Store are much lower than the Play Store, with much stricter guidelines and requirement. If one does not stick to the stipulated instructions while building and providing information about your app, there's almost no chance of your app making it to the App Store.

Apple provides a comprehensive list of guidelines on its developer page. The list is divided into five clear sections: Safety, Performance, Business, Design, and Legal. We'll provide concise and clear summaries of each sec-
