

filtering mechanisms must be present to weed out unwanted comments and content. Most importantly, considering how Apple has been successful at keeping out apps that carry malware and viruses, it has clear guidelines on avoiding user data theft and running background processes that the user has not given permission for. Any apps falling into these negative categories have almost no chance of making it to the App Store.

Under “Performance”, Apple’s mandate is clear: in no way should a developer submit buggy applications that haven’t been fully tested under all conditions and on a multitude of devices. Most importantly, customers should know what they’re getting when they download or buy your app, so make sure your app description, screenshots, and previews accurately reflect the app’s core experience and remember to keep them up-to-date with new versions. Betas and trial versions of apps are rejected: Apple recommends you test them in TestFlight. Under slightly more technical points, apps that run on both an iPhone and iPad and don’t singularly consume all of the device’s resources are allowed to pass the review process. Another point to keep in mind is the usage of private APIs - Apple doesn’t allow the usage of any private API and has instituted automated software to detect the usage of any unapproved APIs.

Though the App Store has been accused of being more pricey and inaccessible than the Play Store, Apple tries to make sure as far as it can that unreasonably priced apps don’t make it to the store either. Almost all of the “Business” section is aimed at making developers understand how to monetize their apps without ripping consumers off. For a more fine-tuned explanation of what kind of payment program can be applied for which category of apps, visit Apple’s guidelines section. In summary, only certain kinds of apps are eligible for subscription renewals every year, and any attempt to cheat users by providing incorrect information about an app’s functionalities can lead to a clear cancellation of your publishing. Apple’s “Design” section is extremely comprehensive, with a separate page devoted to explaining Design Do’s and Don’t using clear imagery as well. Apart from the absolute requirement to follow universal principles of good user interface design such as clearly formatted content, legible text, clear spacing and right alignment, Apple also puts certain restrictions on other design elements: all hit targets should measure at least 44 points x 44 points to make tapping easier and accurate; text colour should have high contrast with the background colour; image assets must be in high resolution so as to avoid looking blurred and distorted on Retina screens and content should
