

If you've read our FastTrack to Android Studio, you'd no doubt have figured out how to develop an app using Android Studio. With Swift, we're going to be doing a somewhat similar task. We are going to be building an iOS app that is essentially an RSS reader like what we made in Android Studio. The app is going to be really simple and take an RSS feed from your favourite website and display it in your phone in a visually appealing (or unappealing) manner. The structure will be rather simple, we will have one view which is the main view or the master view that lists all the items within the RSS feed in neat little cells like an Excel sheet. And once you click on these little cells, you'll be taken to a detailed view which will render the html from the hyperlink within the view.

Understanding an XML Feed

XML stands for eXtensible Markup Language which is quite different from programming languages but similar to HTML. It is used to store and transport data on the web and is fairly self-descriptive. These days JSON is the more popular markup language. It does nothing on its own but we are going to be using the stored data to work. Here's an example from our XML feed from Digit.

```

• <?xml version="1.0" encoding="UTF-8"?>
• <?xml-stylesheet type="text/xsl" media="screen" href="/~d/
styles/rss2full.xsl"?><?xml-stylesheet type="text/css"
media="screen" href="http://feeds.feedburner.com/~d/styles/
itemcontent.css"?><rss xmlns:media="http://search.yahoo.com/
mrss/" xmlns:feedburner="http://rssnamespace.org/feedburner/
ext/1.0" version="2.0">
