

one bucket. Then select Swift as the programming language and under devices, select iPhone for now. Click on Next.

Now you have the IDE prepped for building your app.

Find Main.storyboard and locate the default ViewController as we won't be needing that. On your right panel, i.e. the object library, find TableView-Controller and drag it on to the Main.storyboard.

Now click on Editor in the Menu bar and navigate to 'Embed In', select 'Navigation Controller' in the drop down menu.

Now move to the Project Navigator and locate 'ViewController.swift' under the folder 'DigitReader'. We don't need this for the app, so go ahead and delete it.

Now go back to the 'DigitReader' folder and right-click on it to open the context-menu, select 'New File...'. You will be presented with the template screen again. Click on 'iOS', navigate to 'Source' and select Cocoa Touch Class. Cocoa Touch is a framework that's been developed for making iOS applications and it was built by Apple. It is absolutely necessary if you wish to manipulate objects on your touch screen. So essentially, without it, you
