

After that's done find and uncomment `cellForRowAtIndexPath` function and then add the following lines of code to it.

```
• override func
tableView(tableView: UITa-
bleView!, cellForRowAtInd-
exPath indexPath: NSIndex-
IndexPath!) -> UITableViewCell! {
• let cell = tableView.dequ-
eReusableCellWithIdentifie-
r("Cell", forIndexPath: ind-
exPath) as UITableViewCell
• let showArt: ShowArt =
showArts[indexPath.row]
• cell.textLabel.text =
showArt.postTitle
• return cell}
```

If you check the Table View Cell under `Main.storyboard`, and set the identified to 'Cell'.

Now locate `TableViewController` and set the Class as `DRTableViewController` using the Identity Inspector.

Now you are ready to compile your first every Swift project and give it a go. If you got everything right, you should see a neat table with just the titles from the XML feed that you selected.

Creating the UIWebView for individual posts

We are going to be using the native webview to display the contents of the post. To do this we will need to add another View Controller and then when a user taps the Post Title, they will be show a UIWebView with the link opened. Locate `Main.storyboard` and drag a new View Controller to the storyboard from the object library. Now on your keyboard, press and hold 'Control' and connect the UITableViewCell from `DRTableViewController` to the new
