

Now that you've added the account, close this window and navigate to the General tab of the Xcode project. Under the Identity section, set Team to the newly added account. Xcode should warn you that a matching provisioning profile has not been found. Worry not, we'll settle this in a moment.

Right beneath that little error message, you should see a Fix Issue button. Click it and Xcode should get the rest done.

One last step, open the Settings menu and navigate to Application. And then General > Profile. You should see a profile with your Apple ID over there. Choose that and tap on Trust "Your ID". Chose Trust from the drop down menu and you should be done. If you skip this step you'll be met with a little error message which says that the app you've developed is by an Untrusted Developer. This little step we described above takes care of that.
