

Your account is trusted as long as you have apps under your developer ID, the moment you delete those apps, you will have to perform these steps again.

## Creating a development certificate

Perhaps you're still reading till this point and don't have a developer ID. You can still fiddle around with Xcode but there are a few restrictions on your free account. If you've enrolled in the Apple Developer Program then those restrictions are lifted. And now that we've gotten that out of the way, let's create a development certificate for you. The next chapter covers the entire process in detail but we'll cover it in brief here anyways.

A development certificate consists of a private and a public key pair which links your identity to your developer profile. If you've ever seen an [HTTPS](#) site, then there is an SSL certificate which is verified each time you access the site. We're looking at something similar here with the developer certificate. Xcode uses it to sign your apps. If you've ever obtained an SSL certificate then the process is somewhat similar.

We start by generating a Certificate Signing Request. On your Mac device, open Keychain Access from the applications. Open the Keychain Access menu and click on Certificate Assistant. You should see a Request a Certificate from a Certificate Authority option. Select it. Fill in the form and remember to use the developer ID you've signed up for to do this. Under the Request is radio buttons, ensure you've selected 'Saved to disk' and uncheck 'Let e specify key pair information'.
