

YapDatabaseExtensions

YapDatabaseExtensions enables you to integrate YapDatabase APIs into your Swift code. The YapDatabase is a powerful key value database for both iOS and Mac. To install YapDatabaseExtensions, you need to add the code at the link given below to your podfile pod 'YapDatabaseExtensions'

<http://dgit.in/yapdatabase>

RealmGeoQueries

RealmGeoQueries enables you to integrate proximity search into your iOS applications. Actually, the extension simplifies spatial queries with Realm Cocoa. You need not have to make use of Geohash or other types of indexes in the model class since the extension only accepts latitude and longitude properties. You need to add the following code to install RealmGeoQueries with CocoaPods.

- `platform :ios, '8.0'`
- `pod "RealmGeoQueries"`

Alternatively, you can also install the extension manually. To work with the extension, you need to import the module

- `import GeoQueries`

You can then search with MapView MKCoordinateRegion using the below code

- `let results = try! Realm()`
- `findInRegion(YourModelClass.self, region: mapView.region)`

<http://dgit.in/realmgeo>

Timepiece

Timepiece is an excellent NSDate extension in Swift. With the help of this extension, you can integrate data and time into your Swift apps. You can easily install Timepiece extension either using Cocapods or Carthage. In case of Cocoapods, you need to use the following code

- `pod "Timepiece"`

You need to employ the following code if you wish to install via Carthage.

- `github "naoty/Timepiece"`

<http://dgit.in/timepiece-ext>

SwiftlyTimer

SwiftlyTimer enables you to easily schedule delays and timers which keep
