

on repeating using convenient closure syntax. You need to make use of `NSTimer.every()` and `NSTimer.after()` methods to schedule repeating and non-repeating timers like as shown below

```
• NSTimer.every(0.8.seconds) {
•     statusItem.blink()
• }
• NSTimer.after(10.minute) {
•     println("How are you?")
• }
```

In addition to seconds and minute parameter values, you can also integrate the helpers such as

- `200.ms`, `4.5.seconds`, `10.seconds`, `3.hour` and `7.days`.

AFDateHelper

`AFDateHelper` is a convenient `NSDate` Extension for Swift 2.0 with infinite possibilities. You can display the data and time in all possible formats using the provided methods. For example, if you need to display date from String in a custom format, you need to make use of the following code.

```
• NSDate(fromString: "16 July 2016 8:25:00 ", format:
• .Custom("dd MMM yyyy HH:mm:ss")) -> NSDate
```

In the same way, you can display content related to date and time in wide range of ways. The installation process is very easy and is compatible with both Cocoapods and Carthage.
